

What delays are we looking to see with the forming of this sinkhole?

Hello residents of Coopersville! Just a few days ago, there was a report and recording about a large sinkhole having formed seemingly overnight, and is in the works of being fixed in the next month or so. We home sooner than later, like they say, *"better sooner than later"* while we also see that the delay of using the area where this occurred is until further notice, even after it is constructed again and stable. Even so, there will be routes that are better suited that are to be posted within days so you may carry on in a timely manner without delays that cause work delays and further issues to arise.

Possible causes for the sinkhole

While we aren't sure why this has happened, we are looking into it will construction companies who will be further trying to resolve this issue. There could be multiple reasons though, some consisting of:

- Erosion of key material within infrastructure
- Company made roads in a way that caused the ground to become unstable and forced itself to collapse from constant change of weight
- Bad placements of road that may have simply formed a sinkhole due to prior circumstances before building said road

There may be some other reason, and that is why our team is working with those who saw the incident, and we are also interviewing those who have seen similar in the area. Thats it for now.
